SECTION A

Website: RU Stylish

RU Stylish is a platform for everyone involved in the Rhodes University community to buy and sell second-hand clothing and accessories. We are a student-run marketplace that promotes sustainability and community engagement.

What inspired the website was the lack of nearby thrift stores that cater to students' styles, the need for affordable and stylish clothing, the desire to promote entrepreneurship and more streams of income for other students, as well as providing an online platform for thrifting as modern times do for all other enterprises.

We were able to incorporate most of what was asked of us in the practicals, including side panels, navigation bars, lists, images, tables, reports, security features, login/sign up pages, reviews, tabs, social media links, alignment, and functions. This was not too difficult as our website had many pages and features required for regular users, guests, and administrators. We were also able to add creative features to make our website more appealing and engaging. The ones we could not accommodate in our design were placed in a dummy html file. We divided the labour according to role, strengths, workload, and to suit our current timetables and availability.

The team created multiple HTML files for each page on the website. The HTML created a basic structure for our website, for example, the index (home) page, the login pages, and the 'my account' page. Each page had a navigation bar with hyperlinks to each page, the main content (with tables, divs, images, paragraph tags), and a footer.

A CSS file was created to add styling to the elements and some pages used inline styling. Our brand colours were teal and golden amber- two contrasting colours providing a grounded, friendly, and creative theme; paired up with our bear mascot 'Barry' who, in future, will provide more assistance across all pages. We stuck to the 60-30-10 rule for our design across fonts, cards, forms, navigation and footers. It was also used to correct the layout of all the pages, especially the forms and home page.

A few JavaScript files were created to add interactivity throughout the site and fun functions. We were able to create working side panels, animation, have effective event listeners, filter items, search, handle errors and validation, and gallery movement.

The team used PHP mainly for database connection. We turned all the html files into php files and created a connection to the database. PHP enabled us to create tables and populate them with all user items from reports and reviews to account information and listings using the request type condition and to remove items from tables or change information. It also allowed us to make use of sessions for different situations such as checking if a user is logged in or not in order to make some features available and to check their account type- user or administrator.

We were able to implement security using PHP. This includes but is not limited to checking if a username exists, the validity of the password, and allowing delete permissions for listings/account details that belong to that user. We were able to safeguard against SQL injections and XSS using prepared statements, password hash (which encrypts and salts passwords), password verify, and htmlspecialchars().

SECTION B

REPORT- WEEK 1

(what page is about)

Index.html:

This is the main home page. It includes featured listed items, the navigation bar, and a footer with all the necessary information. It is the first thing that is seen when entering the website.

About.html:

This page shows information about each team member, including a photo and their role on the team.

Cart.html:

This is the page where customers can access the items they plan to purchase. Will include all the items that the customer has added to the cart.

Contact.html:

This is the page that customers can access to get in touch with the team with any queries or feedback. It includes all of the necessary contact information.

Create_account.html:

This is the page that lets customers create an account on the website. Also includes a button that takes the customer to the sign-in page if they already have an account.

Listing.html:

This page is used whenever a user wants to list an item for sale.

Report.html:

This page is used to report any scams, theft, damaged goods, or phishing.

Review.html:

This is for when users want to leave a review on the website and for viewing any reviews that have been made.

SignIn.html:

This is used to sign in to the website and includes a register button that takes you to the create account page if you don't have an account.

View_listing.html:

This page is accessed when a user clicks on a product that they want to view/purchase. It contains information about the product and allows the user to contact the person who listed the product.

Shumirai:

Created the listing page, corrected typos and layout errors and added comments across all pages, created the instagram page, and assisted in creating the logo. Created the footer.

Nstumbedzeni :

Created basic outline, features and template for the html files which include: SignIn, Index(Home page), Create_Account, About, CampusMap and review

Pranay:

Added report page, added view_listing page, Created logo, added basic styling and made the github about page picture table format.

Christopher:

Added the contact us page, implemented a navigation bar across all pages, uploaded all images to the website, corrected errors, and performed some debugging.

Abona:

Made the definition lists and structured the separate roles and each person's pictures. Added multiple contact info for assistance.

REPORT- WEEK 2

File: style.css

Shumirai:

Created the 'create listing' page and a wishlist page. Created the chocacaranilla instagram page, pinterest board and linked the linkedin accounts. Styled the footer with fair spacing and other details. Added the tutorial video to the about us page and styled the page's text, logos, and layout. Edited the reviews page with well formatted review boxes.

Ntumbedzeni :

Fixed the listing items page where items are displayed, basically converted it from a table to a display:grid. Improved the html so it can support css, added dummy icons, and headings. Later improved and finalized by Frontend developer.

Pranay:

Greatly improved on existing css elements mainly the nav bar, footer cleaning up index page and broken html. Use of table and grid elements to style about page and index page. Fixed Broken tutorial video, switched out dummy icons for final ones, added hover effect to nav bar, fixed broken hover effects.

Christopher :

Worked heavily on the navigation bar, and made some changes to the search bar. Made some styling changes to the sign-in and created account pages.

Abona:

Added the css for required tables and all the listing we needed for the entire catalog.

REPORT - WEEK 3

Files: [script.js](#), [slideshow.js](#), products.js, report.js, validate.js

Shumirai:

Added a cool typing feature on the about us page, the last modified date to the footer, the java enabled and browser language buttons to the dummy page. Added the animated bear to the report misconduct page. Fixed the responsiveness of the footer.

Nstumbedzeni:

Created [validate.js](#) to validate forms and [prosduts.js](#) to store and display listed items.(This functions later became null as we used php to achieve this function).Also created [reports.js](#) which is similar to [products.js](#) but instead stores submitted reports.

Pranay:

Created [slideshow.js](#) file implementing background slideshow. Implemented multi-column layouts with scroll features to dummy page. Fixed buggy side bar, fixed buggy icons and made them responsive. Fixed a large line of javascript errors. General css clean up and front end work.

Christopher :

Added a side-bar to all of the existing pages to replace the navigation bar. Made some general bug fixes wherever needed. Added 5 different nav objects.

Abona:

Validated all the report forms and ensured that logins for admin are different from the normal user. Created validation for the creation of accounts and all other forms needed except the sign-in page.

REPORT - WEEK 4

Files: HTML files-> PHP files, logout.php, connection.php, admin.php, admin_reports, admin_reviews, admin_store, admin_overview.php

Shumirai:

Fixed create account form details and validated account creation and connected it to database. Added the PHP for change password, delete account, show my listings, and delete listing features to 'my account.' Used trim, password hash, prepared statements, sessions for security.

Ntumbedzeni :

Created all Administration pages as well as all Administrator attributes. Added all the search functionality, and made the search bar functional. admin_reviews, admin_store, admin_overview.php,, admin.php, admin_reports.

Pranay: Dealt with PHP file organization and merge conflicts. Added css to all new PHP files and forms. Tested PHP validations, verifications and database functionalities.

Christopher :

Made a lot of changes to different backend areas. Added create listing functionality so that all listing information is stored in the database. Made the view listing page. Worked on connecting the user and listing tables in the database. Made changes to the navigation system. Added sessions to make login/signin and logout work.

Abona:

Created the separate tables needed for the database. Connected to the database and ensured all security is enabled and functioning. Validated all inputs through forms to the database making it impossible for sql injections.

REPORT- WEEK 5

Files: RU Stylish documentation

Shumirai:

Documentation.

Nstumbedzeni :

PHP script that reads the log file and detect login attempts

Pranay: Fixed Responsiveness error, added creative features, security testing

Christopher :

Did extra security testing on the back and front end. Confirmed results in documentation.

Abona:

Security testing specifically for number one.

SECTION C

Module Review

Overall, this was a really intense but productive module. Our team was amazing and everyone contributed to our project's success.

What we learnt:

- Clear and effective communication
- Good collaboration
- More version control and VS Code features
- Being initiative

What we could have done better:

- Been more dedicated to our meetings
- Version control
- Doing individually allocated tasks

Challenges with the project and the module:

- Consistent version control with merging and branching. There were merge conflicts and deleting of code and errors with individual branches.
- Working on the same features concurrently caused conflict
- Learning PHP implementation, SQL and security in the same amount of time as HTML
- Some requirements were difficult to understand

Aspects of module that need improvement:

- Time allocated to PHP, SQL and Security, especially if non-relational databases are to be taught in CS202

Did the course meet our expectations:

- Yes, we managed to develop a working website together which is ultimately the goal

Interesting aspects of the module:

- Learning the different ways websites can be hacked
- Learning how user information is sent and collected from databases

Things we wish were improved to make the module achieve its intended purpose:

- Time allocated to PHP, SQL and Security, especially if non-relational databases are to be taught in CS202

Aspects of the module found interesting:

-x

Suggestions for improvement:

- As a lecturer, I'd be more straightforward about the practical applications of the theory and create quizzes that are less concerned with 'gotcha' moments and more concerned with the understanding of classwork

Support from lecturers and tutors. We are grateful for:

- Dr Stones and Mr Welman's constructive feedback
- Mr B. Welman's understanding, support, and detailed marking
- Mr K. Nkomo's assistance

APPENDIX

Link to repository:

<https://github.com/oznugget/RU-Stylesh>

This screenshot shows the main page of the 'RU-Stylesh' repository on GitHub. The repository is owned by 'oznugget' and is public. It has 9 branches, 0 tags, and 299 commits. The 'main' branch is selected. The repository description is 'RU Stylesh website'. The 'About' section shows 0 stars, 0 watching, and 0 forks. The 'Releases' section shows no releases published. The 'Packages' section shows no packages published. The 'Contributors' section shows 5 contributors. The 'README' section is visible, showing the repository name 'RU Stylesh' and the description 'RU Stylesh website'.

This screenshot shows the 'Insights' tab of the 'RU-Stylesh' repository. The date range is 'February 16, 2026 – March 16, 2026' with a period of '1 month'. The 'Overview' section shows 7 Active pull requests and 1 Active issue. The 'Summary' section shows that 7 authors have pushed 185 commits to main and 188 commits to all branches. On main, 124 files have changed and there have been 8,434 additions and 599 deletions. The 'Top Committers' section shows a bar chart of commits by committer. The 'Pulse' section shows 7 Merged pull requests, 0 Open pull requests, 0 Closed issues, and 1 New issue. The 'Contributors' section shows 7 pull requests merged by 2 people, with Kovhi being the top contributor.
